

# Model 2400 Fiberglass Push Rod

**QUICK CHANGE  
ROLLER FLEX™ SYSTEM**

## ***Underground Locating Made Easier With Durable Push Rod and Goldak's "Quick Change Roller-Flex System"***

The Goldak Model 2400 fiberglass push rod is made with quality craftsmanship. The rod is 3/8" diameter and is 400' in length. The rod is marked in one - foot increments allowing the locator to know exactly how far into the line he is. The Goldak Model 2400 is very mobile and weighs only 60 lbs. The newest feature is the Goldak "Quick Change Roller-Flex™ System" that allows removal of the roller ball to an in-line transmitter. No longer having to tape on a transmitter to the push rod allows a smooth transition through tight turns, lowers the risk of jammed or broken rods and loss of expensive transmitters. The stainless steel construction and the streamlined design of the "Quick Change Roller-Flex™ System" allows the operator to use any of Goldak's 2" SR series transmitters in-line on the fiberglass rod for access to 1" conduit. The "Quick Change Roller-Flex™ System" allows the operator to quickly change from a small in-line transmitter to the roller ball for larger tape-on transmitters. The "Quick Change Roller-Flex™ System" is included with the purchase of a Goldak Model 2400 fiberglass push rod.
